Return a list `answer` of size 2 where:

- The values in the two lists should be returned in **increasing** order.

- You should only consider the players that have played **at least one** match.
- The testcases will be generated such that **no** two matches will have the **same** outcome.

Players 1, 2, and 10 have not lost any matches.  
 Players 4, 5, 7, and 8 each have lost one match.  
 Players 3, 6, and 9 each have lost two matches.  
 Thus, `answer[0] = [1,2,10]` and `answer[1] = [4,5,7,8]`.

Players 1, 2, 5, and 6 have not lost any matches.  
Players 3 and 4 each have lost two matches.  
Thus, `answer[0] = [1,2,5,6]` and `answer[1] = []`.

- `1 <= matches.length <= 105`
- `matches[i].length == 2`
- `1 <= winneri, loseri <= 105`
- `winneri != loseri`
- All `matches[i]` are **unique**.
